

Rule curation — one apply engine; main-write only for rules merged to git main (2 approvers)

One engine, two write targets. *Apply* is the same operation whether it writes a candidate branch or **main**: it runs the rules over **all** heads and writes. The only difference is **write** access — rules from a working copy / feature branch may write only a **branch**; write access to **main** accompanies a run only when the rules came from **git main** (post two-person approval). So you iterate on branches freely, and **main** is reached only by merged, approved code — never auto-converge. The headless path augments **new** variants only; every applied change appends a new *sys.start* version, leaving the business (*scd2.start*) history untouched.
