

UI tech stack — two Glue notebooks + a jupyter-text-paired headless Glue job (the .py is the git source of truth)

AWS Glue (Spark sessions & jobs over the Iceberg lake)

One code, three runtimes — all on AWS Glue. The rules are ordinary notebook code: anything that runs in a Glue notebook (PySpark / Python / SQL), not a constrained rules DSL. jupytertext pairs the rules notebook (.ipynb, for interactive design) with a plain .py — the git source of truth, reviewed & merged — and the headless Glue job runs that same committed .py in production, so what you developed interactively is exactly what ships. The deficiency-check notebook is a sibling Glue notebook that scores heads (main or a branch) to sense deficiencies and to test a candidate change. Maps onto the curation UI: deficiency check = Sense / Test, rules notebook = Design / Apply, headless job = production Apply.
